

## Web-site Definition

A Web-Site Definition is a diagram describing how the user interaction is going to be implemented using the selected technologies. The Web-Site Definition defines the navigation through the content and identifies the technological elements (modules, components, links, etc. that contribute to implement the interaction between the user and the application. Develop the Web-Site Definition as a more detailed version of the Dialog Flow Diagram deliverable created during the design of the user interaction model. Use the Web-Site Definition to view the navigation flow of the web-site including its interactions with modules and components.
